

Xpress Personal Identifier (PI) Scan

Having been used successfully by 100% of our customer base since its introduction in the May 2007 elections (with the majority of customers carrying out 100% verification), Xpress PI Scan continues to set the standard for what a signature and date of birth collection and comparison scanning software solution should be.

So what does Xpress PI Scan do?

- Screen layouts designed to replicate the standard canvass and registration scanning software to increase ease of use and familiarity with its processes.
- Includes the Xpress PI Ballot Scan as standard i.e. the facility to scan and record all ballot papers.
- Includes the Xpress PI Remote Scan as standard i.e. the facility to run the Xpress PI scanning software in a non networked Verification or Count location.
- Allows you to scan in up to 9 separate templates.
- Allows you to scan multiple template versions within a single batch and automatically selects the correct template.
- Allows for on-screen access (if required) to the original postal application and postal voting statement when adjudicating mismatches.
- Provides a full testing facility (without the need to create and delete elections).
- Allows you to easily set the verification levels.
- Scans in at 200 dpi, allowing for faster processing speeds.
- Produce detailed batch reports.
- In conjunction with Xpress Register, you can produce a report of non-returned absent voters which lists 25 electors per page, providing details of their date of birth and snippet of their signature (allowing for manual verification).
